2. Why is Django so popular
– Django is special largely because it's based on Model View
Template (MVT) architecture.
– Django Is Implemented in python that is easy to read and has a lot
of powerful computational features

3. Companies that use Django and their products
– Company: Meta
  Product: Instagram
  Use: Its the core of the application, powers sentry that its used
for error reporting

– Company: Google
  Product: Youtube
  Use: First written in php, it was re-written in Django to
implement new features

– Copmany: Spotify Technology S.A.
  Product: Spotify
  Use: Used prototyping services, quick scripts, and building
processes

– Company: Mozilla Foundation
  Product: Mozilla

– Company: Atlassian
  Product: Bitbucket

4.
– You need to develop a web application with multiple users: Yes
because Django comes preinstalled with a user handling module that
is ready to use.

– You need fast deployment and the ability to make changes as you
proceed: Yes because it allows fast creation of apps with a few
installations and is jam-packed with a lot of modules added over a
long period of time to handle most application needs

– You need to build a very basic application, which doesn't require
any database access or file operations: Probably not because flask
would be my go to python framework as its light weight

– You want to build an application from scratch and want a lot of
control over how it works. Yes, because Django does not prevent a
developer from controlling how the application works

– You're about to start working on a big project and are afraid of
getting stuck and needing additional support. Yes, Django has a huge
support base around the world.
